Fork 1.0

FORK: The Decentralized Governance Simulation

A Strategy Game for 6 Stakeholders

I. Introduction

FORK is a high-stakes tabletop simulation of a blockchain ecosystem. Players represent the diverse interests that keep a network alive—and occasionally threaten to destroy it. In this world, trust is a variable, and the protocol is only as strong as the consensus of its peers.

Objective: Accumulate the highest volume of **Tokens ($TK)** by the end of the final "Blockchain Update."

II. Role Assignments & Starting Capital

At the commencement of the game, each player is assigned a Role Card. These roles determine starting capital and provide specific technical advantages.

Role	Qty	Starting $TK	Special Ability
The Miner	2	20	**Processing Power:** Only Miners may compete in the **Puzzle Race** to earn Transaction Fees.
The Whale	1	60	**Asynchronous Liquidity:** May perform a **Transact** action at any time, even outside their turn (except during a Puzzle Race).
The Developer	1	15	**Protocol Lead:** Draws two **Update Cards** and chooses which one to propose to the network.
The Validator	2	25	**Proof of Stake:** Earns a **2 $TK** reward from the Treasury at the start

			of every round.

III. The Token Economy

Turn Protocol

During their turn, a player may perform **one** of the following actions:

1. **Work (Mint):** Receive **1 $TK** from the Treasury (The "Faucet").
2. **Secure:** Pay **2 $TK** to the Treasury to increase the **Network Security Level** by +1.
3. **Transact:** Transfer any amount of tokens to another player.
   - **The Gas Fee:** The sender must pay the **Amount + 2 $TK**.
   - *Example: Sending 10 $TK requires a total payment of 12 $TK.*
4. **Corrupt (51% Attack):** Initiate a takeover of the network. (See Section V).
5. **Role Switch:** *[Governance Era Only]* Propose a role swap with another player.

IV. Mining and Verification

When a **Transact** action is initiated, the network must verify the block.

1. **The Gas Fee:** The sender places the **2 $TK fee** in the center.
2. **The Puzzle Race:** A card is drawn from the **Puzzle Deck**. Both **Miners** race to solve the mathematical or logical challenge.
3. **Resolution:** The first Miner to state the correct answer receives the **2 $TK**. The Whale and other roles are strictly prohibited from interfering in the verification process.

V. The 51% Attack (Corruption)

A player may attempt to corrupt the ledger to seize assets from dissenting players.

- **Investment:** The Attacker must invest $TK equal to the current **Network Security Level**.

- **The Vote:** All other players must vote **YES** (Join the Attack) or **NO** (Defend the Network).

Case A: Majority YES (Success)

The corruption succeeds. The network is breached.

- Every player who voted **NO** must pay **5 $TK**.
- The total sum collected from the NO-voters is distributed evenly among the Attacker and the YES-voters.

Case B: Majority NO (Failure)

The defense holds. The network remains secure.

- The Attacker and all YES-voters **forfeit their entire investment** to the Treasury.
- The players who voted **NO** split a **10 $TK reward** from the Treasury for their vigilance.

VII. Blockchain Updates & Winning

Each round concludes with the **Developer** drawing an **Update Card**. These cards represent protocol changes, hard forks, or economic shifts.

- **The Choice:** Players must choose between Option A or Option B.
- **The Fork:** If the table cannot reach a consensus, the network splits. Players on the "Minority Chain" (the side with fewer players) may face token penalties depending on the card's logic.

The Genesis Conclusion:

The game ends after **10 Blockchain Updates**. All players tally their tokens. The stakeholder with the highest $TK is declared the winner of the network.
